TalentLens

CV discovery with evidence you can inspect

Los pichones de Oveun

Open Agent Hackathon 2026

Recruiters need the reasoning behind a shortlist

01

Understand the role

Translate a job description into professional requirements and open questions.

02

Compare the evidence

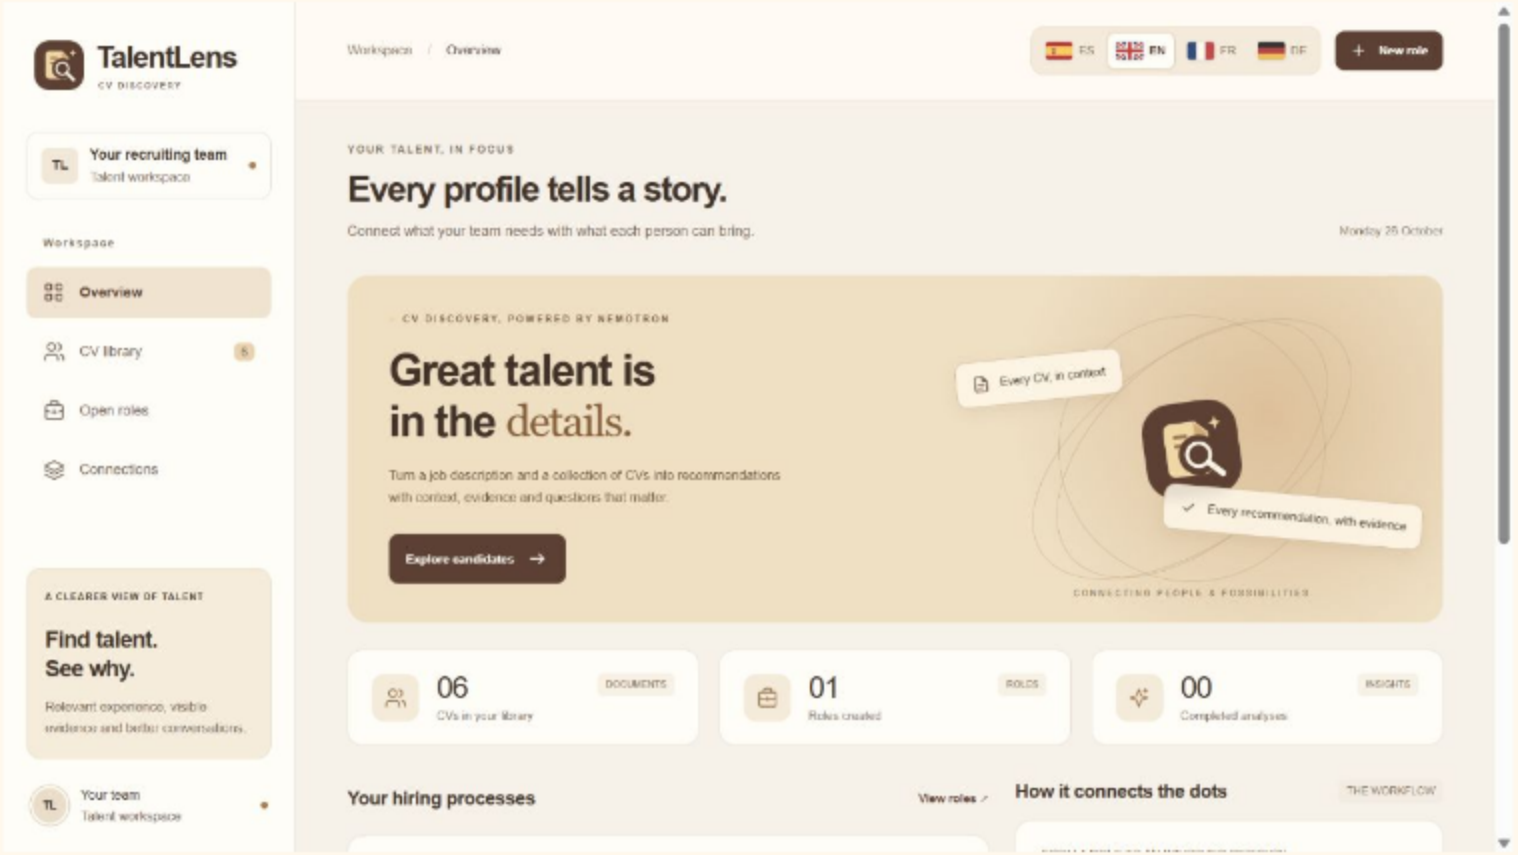

Read a collection of CVs and connect claims to the original documents.

03

Prepare the conversation

Identify gaps, ask targeted questions and keep the next step under human control.

A workspace in four languages

English, Spanish, French and German. Source quotations retain their original wording.

The agent workflow

01 **Zetaris data layer**

Import an authorised candidate view through read-only Lightning REST.

02 **Nemotron understands the role**

Extract requirements and validate each quote against the job description.

03 **H-MEM recalls verified facts**

Retrieve relevant evidence from earlier processes with document and version lineage.

04 **Nemotron compares every CV**

Produce qualitative recommendations, evidence gaps and interview questions.

05 **The recruiter reviews**

Inspect citations, resolve uncertainties and save the next step.

Each sponsor has a working role

Zetaris	Two fictional CSV sources form a joined candidate view. TalentLens reads it through a SELECT-only account.
NVIDIA Nemotron	The model interprets requirements and CVs, proposes candidates and explains evidence and missing information.
Meterless Nightshift	Authenticated inference routes to Nemotron. Reports retain the actual model ID and execution receipts.
Meterless H-MEM	Evidence-backed memory survives restarts and supports later vacancies, source checks and human conflict review.

Memory stays connected to its source

A professional claim

"Led the creation of a design system with 35 components."

Fictional CV: Alex Rivera

First role

Nemotron supports the requirement with a literal CV quote.

After restart

SQLite retains the fact, document version and audit history.

Another role

H-MEM verifies the source and supplies relevant prior evidence to Nemotron.

Recommendations remain open to inspection

Alex Rivera	React and TypeScript, automated tests and a documented design system.
Sam Torres	Backend experience and React dashboards. TypeScript and accessibility need clarification.
Dani Vega	Design systems and accessibility experience. Professional programming experience is not declared.

Qualitative proposals, original quotations and interview questions. A person chooses the next step.

Verification covers evidence, memory and deletion

29

automated tests pass

13 / 13

official H-MEM checks pass

Exact citations and complete candidate coverage

Deletion invalidates in-flight analyses and translations

Source updates, tenant isolation and restart persistence

Prototype boundaries and next improvements

Current scope

Local, single-user workspace

25 CVs per analysis

Text PDFs, DOCX and TXT

Explicit consent before inference

Next improvements

OCR for scanned documents

Production identity and access control

Broader prompt-injection and bias evaluation

Larger, consented evaluation datasets

TalentLens connects a role to verifiable experience

Nemotron proposes candidates.
Recruiters inspect the evidence and decide.
